

Cut Costs and Improve Customer Service Effectiveness

Is your current “Contact Us” web link getting in the way of great customer service? When your customers aren’t allowed to send sensitive information through your website because of regulatory compliance, they must resort to fax, postal mail, or overnight delivery to send you supporting documentation. That’s frustrating for them, inefficient for your customer-facing employees, and drags out resolution times. It wastes time and money, decreases customer satisfaction, and in the end your profits suffer. Fortunately, there’s a better way.

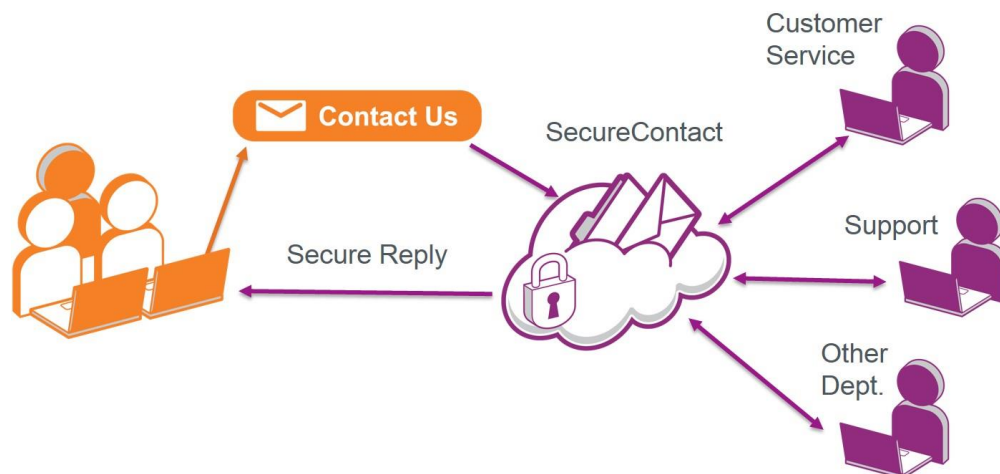

DataMotion’s SecureContact gives your customers a secure communication channel so they can get private information and files to you quickly, and you can resolve their issues faster. Your customer service efficiency and effectiveness will soar.

Secure Client Communications Through Your Website

SecureContact is a hosted service that links right into your website. It turns your “Contact Us” function into a convenient, encrypted pathway for private communications between you and your clients. For example, by using SecureContact your customers can request test results, exchange documents, or ask personal account questions. It also lets them attach any sensitive files securely. Best of all, it’s fully compliant with all industry privacy regulations such as HIPAA,HITECH, PCI, GLBA, and others. Your appropriate department receives the message and its attachments, and can respond with detailed information via the same secured pathway.

SecureContact gives your customers the assurance that you’re handling their private information safely and securely, and lets you rapidly accelerate customer service response times.

- Reduce costs and streamline workflow
- Improve customer retention rates
- Reduce human error and rekeying mistakes
- Improve customer service effectiveness.
- Build trust between you and your customers/clients
- Ensure compliance with privacy regulations
- Minimize security risks
- Provide an additional channel for secure communications

FEATURES

- Compliance-grade encryption for all incoming messages
- Built-in tracking of all messages sent, received, opened
- Cobranded portal
